2.

I did not have any additional features in my project.

3.

Status is complete. I have checked all of the validations of my html code and there are no errors within them.

4.

The challenging parts of this project were the css and date/time parts. For the css, there are like a million different ways to style an object but the hard part is making it the way you want it to be. For example when I was styling the event.html page, I wanted the image to be right next to the text. But I struggled to find out how to wrap the text to the image. Later I found out about float: left which I styled to the image. For the date/time part for the form in the newEvent.html, I struggled to find a way to do that without using javascript. But then later on I found out there is a data type for it.

The easy parts of this project were the html part. I feel like I can code pretty easily in html without getting stuck.
